

Workshop: Monitoring of the NBS effects

26/11/19

The round-table discussion had the aim to give cities the possibility to discuss on how the Frontrunner cities can help the Followers' concerning the NBS monitoring topic.

Participants:

- RINA
- Eindhoven
- Prague
- Tampere

The discussion focused on the following topics:

1) How do you think to measure the positive impact of NBS?

PRAGUE: Surveys

TAMPERE: Measurement devices that can monitor water quantity and quality

EINDHOVEN: Measurement devices to monitor temperature, air and water quality. We have to think about negative effects of NBS (e.g. mosquitos, maintenance costs of green roofs). We have to monitor the problems in order to decide if and how to implement a NBS. In the long term we have to see improvements.

2) Who is going to interpret data?

- The long term monitoring is very important, so keep monitoring the results after the project end
- Make conclusions, plans, statements based on the monitored results and share ideas about them
